</table>
| Agammaglobulinaemia                  | Annarosa Soresina, Nizar Mahlaoui, Hans Ochs, Isabella Quinti                | Fewer than 2% circulating B cells (CD19 and CD20), preferably in two separate determinations and a normal number of T cells (CD3, CD4 and CD8) AND serum IgG levels below:  
- 200 mg/dl in infants aged < 12 months  
- 500 mg/dl in children aged > 12 months  
OR normal IgG levels with IgA and IgM below 2SD AND onset of recurrent infections before 5 years of age  
OR positive maternal family history of agammaglobulinaemia | For patients with normal B cells and agammaglobulinaemia, please consider “Unclassified antibody deficiency”. |
| Asplenia syndrome (Ivemark syndrome) | Nizar Mahlaoui, David Edgar, Stephan Ehl, Capucine Picard, Jean-Laurent Casanova | Asplenia or hyposplenia  
AND Documentation of Howell-Jolly bodies on blood smears  
AND radiological findings evidencing asplenia (US, CT scan, scintigraphy)  
AND heterotaxia defects (dextrocardia, situs inversus, other…) or other heart and great vessel defects |                                                                                         |
| Ataxia telangiectasia (ATM)          | Nizar Mahlaoui, David Edgar, Stephan Ehl, Richard Gatti, Dominique Stoppa-Lyonnet | Ataxia  
AND at least two of the following:  
• Oculocutaneous telangiectasia  
• Elevated alphafetoprotein (tenfold the upper limit of normal)  
• Lymphocyte A-T caryotype (translocation 7;14)  
• Cerebellum hypoplasia on MRI |                                                                                         |
| Autoimmune lymphoproliferative syndrome (ALPS) | David Edgar, Stephan Ehl, Frederic Rieux-Laucat and Benedicte Neven | At least one of the following:  
• Splenomegaly  
• Lymphadenopathy (>3 nodes, >3 months, non-infectious, non-malignant)  
• Autoimmune cytopenia (>1/2 lineages)  
• History of lymphoma  
• Affected family member  
AND at least one of the following:  
• TCRab+CD3+CD4-CD8- of CD3+ T cells>6%  
• Elevated biomarkers (at least 2 of the following):  
  • sFASL > 200pg/ml  
  • Vitamin B12 > 1500ng/L  
  • IL-10 > 20pg/ml  
  • Impaired FAS mediated apoptosis | For patients with lymphoproliferation and/or autoimmunity who do not fulfil these criteria, please consider the following diagnoses:  
• CVID  
• Unclassified combined immunodeficiencies  
• Unclassified disorders of immune dysregulation |

| CSR defects and HiGM syndromes         | Stephan Ehl, Anne Durandy, Teresa Espanol                                    | At least one of the following:  
  - increased susceptibility to infections (recurrent and/or opportunistic, including cryptosporidium)  
  - immune dysregulation (autoimmunity, lymphoproliferation, sclerosing cholangitis)  
  - cytopenia (neutropenia or autoimmune)  
  - malignancy (lymphoma)  
  - affected family member  
  AND marked decrease of IgG (measured at least twice)  
  AND normal or elevated IgM (measured at least twice)  
  AND defined causes of hypogammaglobulinemia have been excluded  
  AND no evidence of profound T-cell deficiency, defined as 2/3 of the following  
    (mo=month, y=year of life):  
    - CD4 numbers/microliter:  
      0-6mo <1000, 6mo-1y <800, 1-2y <500, 2-6y <300, 6-12y <250, >12y <200  
    - % naive CD4: 0-2y <30%, 2-6y <25%, 6-16y <20%, >16y 10%  
    - T cell proliferation absent  
  AND no evidence of Ataxia telangiectasia (cafe-au lait spots, ataxia, telangiectasia, raised AFP) |                                                                                                                                             |
| Chediak Higashi syndrome (CHS)         | Nizar Mahlaoui, David Edgar Stephan Ehl, Genevieve de Saint Basile, Despina Moshous | At least one of:  
  - recurrent bacterial infections  
  - episode of hemophagocytic lymphohistiocytosis (HLH)  
  - Neutropenia  
  - reduced lymphocyte degranulation/cytotoxicity  
  - affected family member  
  AND one of:  
  - Typical hair shaft abnormalities  
  - Presence of intracytoplasmic typical giant granules on blood or bone marrow smears | Immunodeficiency with partial albinism                                                                                                           |

</table>
| Chronic granulomatous disease (CGD)   | Maria Kanariou, Reinhard Seger   | At least one of the following:  
• deep seated infection due to bacteria and/or fungi (abscesses, osteomyelitis, lymphadenitis)  
• recurrent pneumonia  
• lymphadenopathy and/or hepatomegaly and/or splenomegaly  
• obstructing/diffuse granulomata (gastrointestinal or urogenital tract)  
• chronic inflammatory manifestations (colitis, liver abscess and fistula formation)  
• failure to thrive  
• affected family member  
AND absent/significantly decreased respiratory burst  
(NBT or DHR, measured at least twice) |                                                                                                                               |
| Combined immunodeficiency (CID)       | Stephan Ehl, Maria Kanariou, Alain Fischer | At least one of:  
• at least one severe infection (requiring hospitalization)  
• one manifestation of immune dysregulation (autoimmunity, IBD, severe eczema, lymphoproliferation, granuloma)  
• malignancy  
• affected family member  
AND 2 of 4 T cell criteria fulfilled:  
• reduced CD3 or CD4 or CD8 T cells (using age-related reference values)  
• reduced naive CD4 and/or CD8 T cells  
• elevated g/d T cells  
• reduced proliferation to mitogen or TCR stimulation  
AND HIV excluded  
AND exclusion of clinical diagnosis associated with CID (e.g. defined syndromic diseases, DKC, AT, CHH) |                                                                                                                               |

</thead>
</table>
| Common variable immunodeficiency disorders (CVID) | Vojtech Thon, Natalia Martinez, Maria Kanariou, Klaus Warnatz, Isabella Quinti, Helen Chapel | At least one of the following:  
  • increased susceptibility to infection  
  • autoimmune manifestations  
  • granulomatous disease  
  • unexplained polyclonal lymphoproliferation  
  • affected family member with antibody deficiency  
 **AND** marked decrease of IgG and marked decrease of IgA with or without low IgM levels (measured at least twice; <2SD of the normal levels for their age);  
 **AND** at least one of the following:  
  • poor antibody response to vaccines (and/or absent isohaemagglutinins); i.e. absence of protective levels despite vaccination where defined  
  • low switched memory B cells (<70% of age-related normal value)  
 **AND** secondary causes of hypogammaglobulinaemia have been excluded (see separate list below)  
 **AND** diagnosis is established after the 4th year of life (but symptoms may be present before)  
 **AND** no evidence of profound T-cell deficiency, defined as 2 out of the following  
  (y=year of life):  
  • CD4 numbers/microliter: 2-6y <300, 6-12y <250, >12y <200  
  • % naive CD4: 2-6y <25%, 6-16y <20%, >16y <10%  
  • T cell proliferation absent | For patients <4 years old or patients with incomplete criteria please consider “Unclassified antibody deficiency”.  
 For patients with evidence of profound T-cell deficiency, please consider Unclassified combined immunodeficiencies. |

Differential diagnosis of hypogammaglobulinemia

**ADULTS AND (CHILDREN) - Drug Induced:** Antimalarial agents, Captopril, Carbamazepine, Glucocorticoids, Fenclofenac, Gold salts, Penicillamine, Phenytoin, Sulfasalazine  
**CHILDREN AND (ADULTS) - Genetic Disorders:** Ataxia Telangiectasia, Autosomal forms of SCID, Hyper IgM Immunodeficiency, Transcobalamin II deficiency and hypogammaglobulinemia, X-linked agammaglobulinemia, X-linked lymphoproliferative disorder (EBV associated), X-linked SCID, Some metabolic disorders, Chromosomal Anomalies, Chromosome 18q- Syndrome, Monosomy 22, Trisomy 22, Trisomy 21  
**CHILDREN - Infectious Diseases:** HIV, Congenital Rubella, Congenital infection with CMV, Congenital infection with Toxoplasma gondii, Epstein-Barr Virus  
**ADULTS - Malignancy:** Chronic Lymphocytic Leukemia, Immunodeficiency with Thymoma, Non Hodgkin's lymphoma, B cell malignancy  
**CHILDREN AND ADULTS - Systemic Disorders:** Immunodeficiency caused by hypercatabolism of immunoglobulin, Immunodeficiency caused by excessive loss of immunoglobulins (nephrosis, severe burns, lymphangiectasia, severe diarrhea)

| Congenital neutropenia                | Nizar Mahlaoui, Jean Donadieu                                               | Neutropenia below 0.5 g/L measured on at least 3 occasions  
OR Neutropenia below 1 g/L measured on at least 3 occasions with at least one of the following:  
• deep seated infection due to bacteria and/or fungi  
• recurrent pneumonia  
• buccal and/or genital aphthous lesions or ulcerations  
• omphalitis  
• affected family member  
**AND** exclusion of secondary causes of neutropenia                                                                                                                                                                                                                           | For other patients with chronic neutropenia, please consider Unclassified phagocytic disorders.                                                                                                                                                                                                                                |
| Cyclic neutropenia                    | Nizar Mahlaoui, David Edgar, Stephan Ehl, Jean Donadieu                     | Cyclic fluctuation of Neutrophil counts (every 16 to 28 days)  
During these neutropenic episodes, symptoms are at least one of the following:  
• Increased susceptibility to infections  
• Oral aphthae  
• Abdominal pain episodes                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                     |
| Deficiency of specific IgG (Specific antibody deficiency - SPAD) | Nizar Mahlaoui, David Edgar, Stephan Ehl, Helen Chapel, Isabella Quinti, Esther de Vries | Infections (recurrent or severe bacterial)  
**AND** normal serum/plasma IgG, A and M and IgG subclass levels  
**AND** Profound alteration of the antibody responses to S. pneumoniae (or other polysaccharide vaccine) either after documented invasive infection or after test immunization.  
**AND** Exclusion of T cell defect                                                                                                                                                                                                                                         | Unclassified antibody deficiencies                                                                                                                                                                                                                                                                                              |
| DiGeorge syndrome                     | Nizar Mahlaoui, David Edgar, Stephan Ehl                                    | Documented microdeletion 22q11 or 10p  
**AND** signs of immunodeficiency (i.e. infections and/or immune dysregulation)                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                     |
| Dyskeratosis congenita                | Nizar Mahlaoui, David Edgar, Stephan Ehl, Inderjeet Dokal                  | At least two of the following:  
• Skin pigmentation abnormalities  
• Nail dystrophy  
• Mucosal leucoplakia  
• Bone marrow failure  
**AND** Very short telomeres                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                     |
